Blood is a vital fluid that sustains life by transporting nutrients, gases, hormones, and waste products throughout the body. It plays an essential role in immune defense, temperature regulation, and clotting mechanisms. Chapter 10 emphasizes understanding blood's composition, functions, and the processes involved in its regulation.

Composition of Blood

Blood comprises two main components: plasma and formed elements.

Plasma

- Accounts for approximately 55% of blood volume - Composed mainly of water (about 90%) - Contains dissolved substances such as: - Electrolytes (e.g., sodium, potassium) - Nutrients (glucose, amino acids) - Hormones - Waste products (urea, carbon dioxide) - Proteins (albumin, globulins, fibrinogen)

Formed Elements

Formed elements include: - Erythrocytes (Red Blood Cells - RBCs): Responsible for oxygen transport - Leukocytes (White Blood Cells - WBCs): Key players in immune defense - Thrombocytes (Platelets): Essential for blood clotting

Functions of Blood

Blood performs numerous critical functions, including: - Transportation: Moving oxygen, nutrients, hormones, and waste - Regulation: Maintaining pH balance, temperature, and fluid volume - Protection: Providing immune responses and clotting to prevent excessive blood loss

Blood Types and Compatibility

Understanding blood groups is fundamental to transfusion medicine. Blood types are classified based on the presence or absence of specific antigens on the surface of RBCs.

Major Blood Group Systems

- ABO System - Types: A, B, AB, O - Based on presence of A and B antigens - Rh System - Rh-positive (+): presence of Rh (D) antigen - Rh-negative (-): absence of Rh antigen

Compatibility and Transfusions

- Type O negative is considered the universal donor - Type AB positive is the universal recipient - Mismatched transfusions can cause agglutination and hemolytic reactions

Hematopoiesis: Blood Cell Formation

Hematopoiesis is the process of blood cell production, primarily occurring in the bone marrow.

Stages of Hematopoiesis

1. Hematopoietic stem cells differentiate into various blood cell lineages 2. Erythropoiesis produces RBCs in response to erythropoietin 3. Leukopoiesis generates different WBC types 4. Thrombopoiesis produces platelets

Regulation of Blood Cell Production

- Hormones like erythropoietin (EPO), thrombopoietin, and colony-stimulating factors (CSFs) regulate production - Negative feedback mechanisms maintain optimal cell levels

Red Blood Cells: Structure and Function

Red blood cells are specialized cells optimized for oxygen transport.

Characteristics of Erythrocytes

- Biconcave disc shape - Lack nuclei and organelles in mature form - Contain hemoglobin, the oxygen-binding protein

Hemoglobin and Oxygen Transport

- Hemoglobin binds oxygen in the lungs and releases it in tissues - Each hemoglobin molecule can carry four oxygen molecules - The affinity of hemoglobin for oxygen is influenced by factors like pH (Bohr effect), temperature, and CO₂ levels

White Blood Cells and Immunity

White blood cells are crucial for immune defense, fighting infections, and removing debris.

Types of Leukocytes

- Granulocytes: Neutrophils, eosinophils, basophils - Agranulocytes: Lymphocytes (B and T cells), monocytes

Functions of WBCs

- Phagocytosis of pathogens - Producing antibodies - Mediating allergic responses - Coordinating immune responses

Platelets and Clotting Mechanisms

Platelets are cell fragments that initiate blood clotting to prevent blood loss.

Role in Hemostasis

- Formation of a platelet plug at injury site - Activation of clotting factors leading to fibrin mesh formation - Clot retraction and tissue repair

Clotting Cascade

- Intrinsic and extrinsic pathways converge into a common pathway - Activation leads to thrombin formation - Thrombin converts fibrinogen into fibrin, stabilizing the clot

Blood Disorders Covered in Chapter 10

Understanding common blood disorders helps in diagnosis and treatment.

Examples of Blood Disorders

- Anemia: Reduced RBC count or hemoglobin levels - Leukopenia: Low WBC count - Leukemia: Malignant proliferation of abnormal WBCs - Thrombocytopenia: Low platelet count - Hemophilia: Bleeding disorder due to clotting factor deficiency - Polycythemia: Excess RBCs leading to thick blood

Maintaining Homeostasis and Blood Regulation

The body employs various mechanisms to regulate blood composition and volume: - Erythropoiesis regulation: Stimulated by hypoxia - Fluid balance: Controlled by kidneys and plasma proteins - pH balance: Buffer systems maintain blood pH around 7.35-7.45 - Blood volume regulation: Adjusted via hormonal influences like ADH and aldosterone
