Understanding the Law of Universal Gravitation

What Is the Law of Universal Gravitation?

The law of universal gravitation states that every mass attracts every other mass in the universe with a force that is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centers. Formulated by Sir Isaac Newton in 1687, this law explains the gravitational attraction that keeps planets in orbit, causes objects to fall to the ground, and governs the motion of celestial bodies. Mathematically, it is expressed as:

$$1. F = G (m_1 m_2) / r^2$$

Where: - F is the magnitude of the gravitational force between the two objects - G is the gravitational constant ($\sim 6.674 \times 10^{-11} \text{ N} \cdot (\text{m}/\text{kg})^2$) - m_1 and m_2 are the masses of the objects - r is the distance between the centers of the two masses

Sample Exercises from a Universal Gravitation Worksheet

To illustrate the depth and variety of questions, here are sample exercises often found in such worksheets:

Exercise 1: Conceptual Understanding

Question: Explain why astronauts experience weightlessness in orbit, even though gravity is still acting on them. Answer: Astronauts are in continuous free fall around Earth, meaning they are moving forward at a speed that keeps them falling around the planet. Since both they and their spacecraft are accelerating equally under gravity, they do not feel weight; this condition is known as apparent weightlessness.

Exercise 2: Calculation

Question: Calculate the gravitational force between the Sun (1.989×10^{30} kg) and Earth (5.972×10^{24} kg), given that the average distance between them is about 149.6 million km. Solution: Convert distance to meters: $149.6 \times 10^6 \text{ km} = 1.496 \times 10^{11} \text{ m}$. Apply the formula: $F = G \frac{m_{\text{Sun}} \times m_{\text{Earth}}}{r^2}$ Plugging in values: $F = 6.674 \times 10^{-11} \times \frac{(1.989 \times 10^{30}) \times (5.972 \times 10^{24})}{(1.496 \times 10^{11})^2}$ Calculating yields approximately 3.54×10^{22} Newtons.

Exercise 3: Graphing

Task: Plot how the gravitational force varies with distance for two objects of fixed masses. Discuss the significance of the inverse square law.
