Questions & Answers About the immune system biointeractive

No	Question	Answer
1	What is the primary function of the immune system in the human body?	The primary function of the immune system is to protect the body from harmful pathogens such as bacteria, viruses, fungi, and parasites, while also recognizing and eliminating abnormal cells like cancer cells.
2	How do vaccines help in strengthening the immune system?	Vaccines stimulate the immune system to recognize and remember specific pathogens by introducing harmless components or weakened forms of the pathogen, thereby enabling the body to mount a faster and more effective response upon actual exposure.
3	What role do white blood cells play in immune defense?	White blood cells, or leukocytes, are crucial components of the immune system that identify, attack, and destroy pathogens and infected cells, as well as coordinate immune responses through signaling molecules like cytokines.
4	How does the immune system distinguish between self and non-self?
