Operation Principles of the Hyundai D4HB

Basic Working Cycle

The Hyundai D4HB engine operates on the four-stroke cycle—intake, compression, power, and exhaust. Its turbocharging system increases air intake, boosting power and efficiency. The direct injection system atomizes diesel fuel directly into the combustion chamber, resulting in better fuel combustion and lower emissions.

Turbocharging and Intercooler

The turbocharger compresses incoming air, increasing the density of air entering the cylinders, which enhances power output. An intercooler cools this compressed air before it enters the combustion chamber, further improving efficiency and performance.
