Introduction to Female Fetal Pig Anatomy

The fetal pig serves as a representative mammalian model, sharing key organ systems such as the circulatory, respiratory, digestive, reproductive, and nervous systems. Recognizing the anatomical features of the female fetal pig is essential for understanding reproductive biology, developmental processes, and comparative anatomy across species. Key features of female fetal pig anatomy include: - External genitalia and urogenital structures - Internal reproductive organs - Circulatory and respiratory systems - Digestive system - Nervous and sensory structures This overview will explore each system in detail, emphasizing the unique features of the female fetal pig.

External Anatomy of the Female Fetal Pig

Understanding external features provides a foundation for locating internal structures during dissection.

External Genitalia and Urogenital Opening

- Vulva: The external opening of the female reproductive system, located ventrally on the pig's urogenital region. - Clitoris: A small protrusion situated near the vulva, homologous to the human clitoris. - Urogenital opening: Located ventrally, through which both urinary and reproductive tracts open in females. - Urogenital papilla: A small, fleshy projection that covers the urogenital opening, more prominent in females. External features to identify: - The pig's ventral side (belly) shows the urogenital opening near the hind legs. - The area is usually moist and may have hairless patches to aid in identification.

Internal Reproductive System

The reproductive system is a central focus in female fetal pig dissection, showcasing the development of vital organs.

Ovaries

- Located dorsally within the abdominal cavity, near the kidneys. - Small, oval-shaped structures that contain developing eggs (ova). - Usually palpable during dissection and often appear as nodular structures.

Oviducts (Fallopian Tubes)

- Tubular structures extending from the ovaries toward the uterus. - Serve as pathways for ova to travel from the ovaries to the uterus. - In fetal pigs, the oviducts are relatively thin and delicate.

Uterus

- Y-shaped or bicornuate (two horns) in structure. - Located centrally in the abdominal cavity. - Composed of two uterine horns that merge into a single uterine body. - In fetal development, the uterus is small but distinguishable.

Cervix

- The narrow passage connecting the uterus and the vagina. - Not always easily visualized during early dissection but can be identified as a constricted region of the uterus.

Vagina and External Opening

- The vagina extends from the cervix to the urogenital opening. - During dissection, the vaginal canal can sometimes be traced leading to the external urogenital opening.

Circulatory System in Female Fetal Pigs

The circulatory system is critical for delivering nutrients and oxygen during development.

Heart

- Located in the thoracic cavity, slightly left of the midline. - Four chambers: right and left atria, right and left ventricles. - The fetal pig's heart is similar to that of humans, with visible arteries and veins emerging from the heart.

Major Blood Vessels

- Aorta: Main artery carrying oxygenated blood from the heart to the body. - Vena Cava (superior and inferior): Carry deoxygenated blood from the body to the heart. - Umbilical arteries and vein: Present during fetal development, connecting the fetus to the placenta (or analogous structures in the dissection).

Respiratory System

The respiratory system facilitates gas exchange.

Lungs

- Located in the thoracic cavity, dorsal to the heart. - In fetal pigs, lungs are not fully developed and may appear less prominent. - Dissection involves identifying the trachea leading to the lungs.

Trachea and Bronchi

- The trachea is a tube extending from the larynx to the lungs. - Branches into bronchi entering each lung.

Digestive System

The digestive system is extensive, extending from the oral cavity to the anus.

Oral Cavity and Esophagus

- The oral cavity includes the tongue, teeth, and palate. - The esophagus runs dorsal to the trachea, connecting the pharynx to the stomach.

Stomach

- Located on the left side of the abdominal cavity. - The stomach is a sac-like structure that begins the digestion process.

Intestines

- Small intestine: Long, coiled tube where most nutrient absorption occurs. - Large intestine (colon): Absorbs water and forms feces. - Follows the small intestine, leading to the rectum and anus.

Accessory organs

- Liver: Large, lobed organ that produces bile. - Gallbladder: Small sac beneath the liver storing bile. - Pancreas: Located near the stomach, secreting digestive enzymes and insulin.

Nervous System

The nervous system coordinates bodily functions.

Brain

- Located within the skull, protected by the skull bones. - Divided into regions: cerebrum, cerebellum, and brainstem.

Spinal Cord

- Runs through the vertebral column. - Connects the brain to peripheral nerves.

Peripheral Nerves

- Extend to various organs and tissues, transmitting sensory and motor signals.
