Reactivity and Color Changes

- Acids react with metals like zinc, magnesium, and iron, releasing hydrogen gas. - Bases react with fats and oils to produce soap (saponification). - Indicators such as litmus, phenolphthalein, and methyl orange help detect acidity or alkalinity via color changes.

Quantitative Measures of Acidity and Basicity

1. pH Scale

- Ranges from 0 to 14. - pH less than 7 indicates acidity. - pH exactly 7 is neutral. - pH greater than 7 indicates alkalinity. Calculation of pH: $\text{pH} = -\log[\text{H}^+]$ - For example, if $[H^+] = 1 \times 10^{-3} \text{ M}$, then $\text{pH} = 3$.

2. pOH and Relationship to pH

- pOH measures hydroxide ion concentration: $\text{pOH} = -\log[\text{OH}^-]$ - At 25°C , the relationship: $\text{pH} + \text{pOH} = 14$ - This helps in calculating one when the other is known.

3. Acid and Base Strength

- Strong acids/bases dissociate completely in water. - Weak acids/bases dissociate partially, reaching an equilibrium. - Examples: - Strong acids: HCl , H_2SO_4 , HNO_3 . - Weak acids: Acetic acid, carbonic acid. - Strong bases: NaOH , KOH . - Weak bases: Ammonia (NH_3).

Acid-Base Equilibria and Titrations

1. Acid-Base Equilibrium

- Involves the reversible dissociation of acids and bases. - The equilibrium constant (K_a for acids, K_b for

bases) quantifies their strength. - Example: For acetic acid: $\text{CH}_3\text{COOH} \rightleftharpoons \text{H}^+ + \text{CH}_3\text{COO}^-$ - The smaller the K_a , the weaker the acid.

2. Titration Process

- A method to determine unknown concentrations. - Involves gradual addition of a titrant (known concentration) to analyte until equivalence point. - Indicators signal the endpoint via a color change. Common Indicators: - Phenolphthalein: Clear in acids, pink in bases. - Methyl orange: Red in acids, yellow in bases. Titration Calculations: - Based on molarity (M) and volume (V): $M_1V_1 = M_2V_2$ - Used to find unknown concentrations.

Acid-Base Strength and pKa

Understanding pKa

- pKa is the negative logarithm of K_a : $\text{pKa} = -\log K_a$ - Indicates the acidity of a compound. - Lower pKa values mean stronger acids. - Typical pKa values: - Hydrochloric acid (HCl): ~ -7 - Acetic acid: ~ 4.76 - Water: 15.7

Relationship Between Acid Strength and Conjugates

- Strong acids have weak conjugate bases. - Weak acids have relatively stronger conjugate bases. - The stability of conjugate bases influences acid strength.
