Practical

Immobilised enzymes A level biology practical Understanding the concept of immobilised enzymes is fundamental to many practical applications in biology, particularly at the A level. Immobilised enzymes are enzymes that are attached to or confined within a solid support, allowing them to catalyse reactions without being lost in the process. This technique is widely used in laboratory experiments and industrial processes due to its advantages such as reusability, stability, and ease of separation from products. In this article, we will explore the practical aspects of immobilised enzymes in a level biology context, including their preparation, applications, and the methodology of typical experiments.

What Are Immobilised Enzymes?

Immobilised enzymes are enzymes that have been fixed onto a solid support or trap within a matrix, preventing their diffusion away from the reaction site. Unlike free enzymes that are dissolved in solution, immobilised enzymes offer several practical benefits:

- Reusability: They can be used multiple times without the need for replenishing enzyme supply.
- Enhanced stability: Immobilisation often increases enzyme stability against pH and temperature changes.
- Ease of separation: Facilitates straightforward separation of enzymes from reaction products.
- Controlled reaction conditions: Allows for better control over reaction parameters.

Preparation of Immobilised Enzymes in the Laboratory

Preparing immobilised enzymes for practical experiments involves several key steps. These steps are essential for ensuring the enzyme remains active and is effectively immobilised.

Materials Required

- Enzyme solution (e.g., amylase, catalase) - Solid support material (e.g., alginate beads, glass beads, cellulose) - Cross-linking agents (e.g., glutaraldehyde) - Buffer solutions (e.g., phosphate buffer) - Equipment: syringe, beakers, stirring rod, water bath, pipettes, filtration apparatus

Common Methods of Immobilisation

1. Encapsulation in Beads: - Enzymes are trapped within a gel matrix such as sodium alginate. - Procedure: - Mix enzyme solution with sodium alginate. - Drop the mixture into a calcium chloride solution to form beads. - Rinse the beads thoroughly before use.

2. Adsorption: - Enzymes are adsorbed onto the surface of a solid support via physical forces. - Simple but less stable over time.

3. Covalent Bonding: - Enzymes are linked covalently to the support using cross-linking agents like glutaraldehyde. - More stable and suitable for industrial applications.

4. Cross-Linking: - Enzymes are linked together using bifunctional agents, forming insoluble aggregates.

Understanding Enzyme Immobilisation

What Are Immobilised Enzymes?

Immobilised enzymes are enzymes that have been physically confined or localized onto or within a solid support matrix, allowing them to be separated from the reaction mixture easily and reused multiple times. Unlike free
