Introduction to Petrochemical Production

Petrochemicals are chemical products derived from petroleum and natural gas. They form the backbone of numerous industries, including plastics, fertilizers, pharmaceuticals, and textiles. The primary goal of petrochemical production processes is to convert raw hydrocarbons into useful chemical building blocks such as olefins, aromatics, and synthesis gases. The production processes are typically divided into two broad categories: - Steam Cracking - Catalytic Processes Each method involves specific technological steps, catalysts, and operating conditions tailored to produce different types of petrochemicals.
