Sterilizing your substrate eliminates unwanted microbes.

1. **Use a pressure cooker:** Sterilize jars at 15 psi for 60-90 minutes.
2. **Cooling:** Allow jars to cool completely before inoculation to prevent spore damage.

3. Inoculation with Spores

This is the process of introducing spores into the substrate.

1. **Prepare workspace:** Work in a sterile environment, disinfect surfaces with alcohol.
2. **Inject spores:** Use sterile syringes to inject 1-2 cc of spore solution into each jar through the filter or hole.
3. **Seal jars:** Ensure lids are secure to prevent contamination.

4. Incubation and Colonization

The spores need time to develop into mycelium.

1. **Place jars:** Store in a dark, warm location (75-80°F or 24-27°C).
2. **Monitor progress:** Mycelium appears as white, thread-like growth filling the substrate.
3. **Patience:** Colonization can take 2-4 weeks. Avoid disturbing the jars during this period.

5. Initiating Fruiting

Once the substrate is fully colonized, it's time to induce mushroom formation.

1. **Prepare fruiting chamber:** Use a plastic tote or similar container, with holes for air exchange.
2. **Increase humidity:** Maintain 90-100% humidity using perlite or humidifiers.
3. **Provide light:** Indirect sunlight or fluorescent light for 12 hours daily.

Step-by-Step Guide to Growing *Psilocybe Cubensis*

Growing *Psilocybe cubensis* involves several stages: preparation, inoculation, incubation, colonization, and fruiting. Below is a detailed walkthrough.

1. Preparing the Substrate

The substrate provides nutrients for mushroom growth. A common recipe is the "PF Tek" method, which uses brown rice flour, vermiculite, and water. Steps: - Mix 2 parts vermiculite with 1 part water until moist but not soggy. - Add 1 part brown rice flour to the mixture. - Fill sterilized jars with this mixture, leaving some space at the top. - Cover with lids that have small holes or breathable filters to allow gas exchange. Pros of PF Tek: - Simple and beginner-friendly. - Requires minimal

equipment. - Produces reliable results. Cons: - Limited yield compared to bulk methods. - Needs careful sterilization to prevent contamination.

2. Sterilization and Inoculation

Sterilization: - Place filled jars in a pressure cooker. - Sterilize at 15 psi (121°C) for 45-60 minutes. - Allow jars to cool completely before inoculation to prevent spore damage. Inoculation: - Work in a clean, sterile environment. - Use alcohol wipes to sterilize tools and workspace. - Inject spores into each jar through the holes using a sterile syringe. - Seal the holes with micropore tape or breathable filters. Tips: - Use gloves and face masks to minimize contamination. - Inoculate in a dark, clean area.

3. Incubation and Colonization

- Store inoculated jars in a warm, dark place (75-80°F / 24-27°C). - Maintain consistent temperature; fluctuations can cause contamination. - Wait 2-4 weeks for the mycelium to fully colonize the substrate, appearing as white, thread-like growth. Monitoring: - Check jars periodically for any signs of contamination (colored molds, bad odors). - Keep humidity high and avoid opening jars during colonization.

4. Initiating the Fruiting Stage

Once colonization is complete: - Remove the substrate cakes from the jars. - Rinse gently with water to remove any residual vermiculite. - Place the cakes onto a fruiting chamber, such as a tray with moist perlite or a plastic container with holes for airflow. - Maintain high humidity (around 90%) and fresh air exchange. - Provide indirect light for 12 hours a day to stimulate fruiting. Features of a Good Fruiting Environment: - Temperature: 70-75°F (21-24°C). - Humidity: 85-95%. - Fresh air circulation. 5. Harvesting and Post-Harvest Care - Mushrooms typically mature in 1-2 weeks after pinning. - Harvest when the veil just starts to tear or the cap fully opens. - Use clean scissors or knives to cut mushrooms at the base. - Dry the mushrooms using a dehydrator or air drying in a well-ventilated space. Pros of Proper Harvesting: - Prevents over-maturation and spore release. - Ensures potency and freshness.

Additional Tips and Troubleshooting

Cultivation isn't always smooth sailing. Here are some common issues and solutions: Contamination - Signs: Unusual colors (green, black, pink mold), foul smell. - Solution: Maintain sterilization protocols, use fresh spores, and work in sterile environments. Poor Yield - Causes: Substrate too dry or too wet, temperature fluctuations, inadequate lighting. - Solution: Adjust moisture levels, maintain stable environment, and ensure proper lighting. Slow Growth - Causes: Suboptimal temperature or humidity. - Solution: Use heating mats or humidifiers, and keep environmental conditions consistent.
