Sample Questions and Answer Strategies

Sample Math Question

Question: A roller coaster reaches a height of 150 meters. Assuming no air resistance, what is the velocity of the

coaster at the bottom of the drop? (Use $g = 9.8 \text{ m/s}^2$) Answer Strategy: - Use conservation of energy principle: potential energy at the top = kinetic energy at the bottom. - Potential energy (PE) = $m g h$. - Kinetic energy (KE) = $0.5 m v^2$. - Since mass cancels out, $v = \sqrt{2 g h}$. - Calculation: $v = \sqrt{2 \cdot 9.8 \cdot 150} \approx \sqrt{2940} \approx 54.2 \text{ m/s}$. Answer: Approximately 54.2 m/s.

Sample Science Question

Question: Why are roller coasters designed with safety features like harnesses and brakes? Explain using physics principles. Answer Strategy: - Harnesses prevent riders from being ejected during high-speed turns and drops, applying Newton's First Law. - Brakes are used to slow down or stop the coaster, utilizing principles of friction and deceleration. - Design considerations ensure that forces experienced by riders (g-forces) stay within safe limits, based on Newton's Second Law. Answer: Safety features like harnesses and brakes are designed based on physics principles such as Newton's Laws to protect riders by controlling forces and preventing ejection during high-speed movements.
