Core Principles in Heat Transfer as Explored in P.K. Nag

Fourier's Law of Heat Conduction

At the heart of conduction heat transfer lies Fourier's Law, which states:

The heat flux through a material is proportional to the negative gradient of temperature and the material's thermal conductivity.

Mathematically:

$$\mathbf{Q} = -k \nabla T$$

Where:

1. $\mathbf{Q}$ = heat flux vector (W/m²)
2. k = thermal conductivity (W/m·K)
3. ∇T = temperature gradient

P.K. Nag emphasizes understanding the physical significance of this law, its assumptions, and its applications in different geometries.

Convection: Heat Transfer Coefficient and Nusselt Number

Convection involves fluid motion, and its analysis hinges on the convective heat transfer coefficient, h .

1. Newton's Law of Cooling:

$$Q = h A (T_{\text{surface}} - T_{\text{fluid}})$$

Where:

1. A = surface area
2. T_{surface} = surface temperature
3. T_{fluid} = fluid temperature

P.K. Nag discusses methods to determine h using experimental correlations involving the Nusselt number (Nu), which characterizes convective heat transfer relative to conduction:

$$Nu = (h L) / k$$

Where L is the characteristic length. The book explores empirical correlations for different flow regimes and geometries.

Radiative Heat Transfer

Radiation involves electromagnetic waves, and P.K. Nag covers:

1. Stefan-Boltzmann Law
2. Blackbody radiation
3. View factors and geometric considerations
4. Radiative heat exchange between surfaces

Understanding these principles is critical in high-temperature systems like furnaces and space applications.

Mass Transfer Fundamentals in P.K. Nag's Framework

Fick's Laws of Diffusion

Mass transfer by diffusion is governed by Fick's Laws:

1. First Law: Steady-state diffusion flux proportional to concentration gradient:

$$\mathbf{J} = -D \nabla C$$

Where:

1. $\mathbf{J}$ = diffusion flux (kg/m²·s)
2. D = diffusion coefficient
3. C = concentration

1. Second Law: Describes how concentration changes over time for unsteady diffusion.

P.K. Nag elaborates on these laws, their assumptions, and their application in both gaseous and liquid systems.

Convective Mass Transfer

Analogous to heat transfer, convective mass transfer involves fluid motion. The key parameter is the mass transfer coefficient (k_m), with the analogy to the heat transfer coefficient:

1. Mass transfer rate:

$$J = k_m A (C_{\text{surface}} - C_{\text{bulk}})$$

1. Dimensionless numbers:

1. Sherwood number (Sh), analogous to Nusselt number
2. Reynolds number (Re)
3. Schmidt number (Sc)

Correlations involving these dimensionless numbers help predict mass transfer rates in different flow regimes.

Coupled Heat and Mass Transfer

In real-world processes, heat and mass transfer often occur together, influencing each other.

Modes of Coupled Transfer

1. Simultaneous transfer: Both heat and mass transfer occur at the same interface or within the same system.
2. Counter-current and co-current flows: Common in heat exchangers and absorption towers.
3. Phase change processes: Evaporation, condensation, sublimation.

Analytical and Numerical Approaches

P.K. Nag discusses methods for analyzing coupled phenomena:

1. Analytical Solutions: For simple geometries and boundary conditions.
