4. Preparation for assessments: Many tests and standardized exams include problems involving one step equations.

What is a One Step Equation?

A one step equation is an algebraic equation that can be solved with a single operation. Typically, these involve one variable and one operation, such as addition, subtraction, multiplication, or division.

Examples include:

1. $x + 5 = 12$
2. $y - 3 = 7$
3. $4z = 20$
4. $\frac{w}{2} = 9$

The goal in solving these equations is to isolate the variable on one side of the equation to determine its value.

Key Concepts for Solving One Step Equations

To effectively solve one step equations, students need to understand several core concepts:

1. Inverse Operations

Inverse operations are mathematical operations that undo each other. For example:

1. Addition and subtraction
2. Multiplication and division

Knowing these is crucial because each step in solving an equation involves applying the inverse operation to isolate the variable.

1. Maintaining Balance

Equations are like scales; whatever operation you perform on one side, you must perform on the other to keep the equation balanced.

1. Simplification

Before solving, simplify both sides of the equation if necessary, combining like terms or removing parentheses.

Step-by-Step Process for Solving One Step Equations

A systematic approach helps students solve these equations efficiently:

Step 1: Identify the operation involving the variable.

Determine whether the variable is being added, subtracted, multiplied, or divided.

Step 2: Use inverse operations to isolate the variable.

Apply the inverse operation to both sides of the equation.

Step 3: Simplify both sides after applying the inverse operation.

Perform calculations to reduce the equation to the variable's value.

Step 4: Check the solution.

Substitute the found value back into the original equation to verify correctness.

Practical Examples

Let's explore some examples with detailed steps:

Example 1: Solve $x + 7 = 15$

1. Step 1: The operation is addition (+7).
2. Step 2: Subtract 7 from both sides: $x + 7 - 7 = 15 - 7$
3. Step 3: Simplify: $x = 8$
4. Step 4: Check: $8 + 7 = 15$ ✓ Correct.

Example 2: Solve $3y = 12$

1. Step 1: The operation is multiplication by 3.
2. Step 2: Divide both sides by 3: $\frac{3y}{3} = \frac{12}{3}$
