Core Concepts in Signal and Systems

Signals: Types and Properties

Definition of a Signal A signal is a function that conveys information about the behavior or attributes of some phenomenon. It can be continuous-time or discrete-time, deterministic or random.

Types of Signals

- Continuous-time signals: Defined for all real numbers (e.g., analog audio signals)
- Discrete-time signals: Defined only at discrete instances (e.g., digital audio samples)

Signal Properties

- Energy signals: Have finite energy, integral of the squared magnitude is finite
- Power signals: Have finite power, average power over time is finite
- Periodic signals: Repeat after a fixed interval
- Aperiodic signals: Do not repeat periodically

Systems: Characteristics and Classifications

Definition of a System A system is a process or device that transforms an input signal into an output signal, often described mathematically through functions or differential/difference equations.

System Properties

- Linearity: Superposition principle applies
- Time-invariance: System behavior does not change over time
- Causality: Output depends only on current and past inputs
- Stability: Bounded inputs produce bounded outputs

Time-Domain Analysis Signal Operations

Operations such as shifting, scaling, and superposition are fundamental in analyzing signals.

System Response

- Impulse response: The output when the input is an impulse; characterizes linear time-invariant (LTI) systems completely
- Convolution: Mathematical operation describing the output of an LTI system as the convolution of input and impulse response

Differential and Difference Equations

- Continuous systems are often modeled via differential equations
- Discrete systems are modeled via difference equations

Fourier Analysis

Fourier Series Decomposes periodic signals into sums of sinusoidal components, useful for analyzing signal spectra.

Fourier Transform Extends Fourier Series to non-periodic signals, providing a frequency domain representation of signals.

- Convolution theorem
- Parseval's theorem (relation between time and frequency domain energies)

Laplace and Z-Transforms

Laplace Transform A powerful tool for analyzing continuous-time systems, especially for differential equations.
