What Is the ASHRAE Heat Balance Method?

The ASHRAE heat balance method is a mathematical procedure used to determine the internal and external heat gains and losses in a building or space. Unlike simplified rules of thumb, this method rigorously accounts for all heat transfer mechanisms, including conduction, convection, radiation, and infiltration. It essentially ensures that the internal heat gains (such as occupants, lighting, and equipment) are balanced against the heat removed by the HVAC system, maintaining thermal comfort and energy efficiency.

Core Principles:

1. Conservation of Energy: The method is grounded in the principle that energy entering and leaving a space must be balanced over a given period.
2. Steady-State and Transient Conditions: It can be applied to steady-state conditions (constant conditions over time) or to transient conditions (changing conditions over time).
3. Comprehensive Heat Sources and Sinks: It considers all sources of heat gain and loss, including internal equipment, solar radiation, ventilation, and infiltration.

The Foundations of the Heat Balance Method

1. Heat Gains in Buildings

Understanding heat gains is crucial for accurate load calculations. These gains come from:
