Preoperative Assessment and Preparation

Importance of Thorough Evaluation

Preoperative assessment forms the foundation of safe anesthesia practice. It involves evaluating the patient's medical history, physical status, and potential risk factors that could influence anesthesia management.

Key Elements

1. Medical History Review: Chronic conditions (e.g., hypertension, diabetes), previous anesthesia experiences, allergies, medication use.
2. Physical Examination: Airway assessment (Mallampati score, neck mobility), cardiovascular and respiratory evaluation, neurological status.
3. Laboratory and Diagnostic Tests: Blood work, imaging studies, ECG, pulmonary function tests, as indicated.
4. Risk Stratification: Using tools like ASA (American Society of Anesthesiologists) Physical Status Classification to categorize patient risk.

Preparation Strategies

1. Optimization of comorbid conditions.
2. Medication adjustments.
3. Patient education about anesthesia and perioperative expectations.
4. Fasting guidelines adherence to reduce aspiration risk.

Anesthesia Induction and Maintenance

Anesthesia Induction Protocols

The goal during induction is to render the patient unconscious, pain-free, and immobile while maintaining hemodynamic stability.

Common Induction Agents:

1. Propofol: Rapid onset, antiemetic properties.
2. Etomidate: Hemodynamically stable, often used in cardiac patients.
3. Ketamine: Provides analgesia and anesthesia, useful in trauma or asthmatic patients.
