Common Control Systems Exam Question Solutions

Below are detailed solutions to some typical control systems exam questions, illustrating effective techniques and best practices.

Example 1: Derive the Transfer Function of a Given System

Question: Given a system with the following block diagram, derive the transfer function $T(s) = \frac{Y(s)}{U(s)}$. System components: - Forward path gain: $G(s) = \frac{K}{s(Ts + 1)}$ - Feedback path: unity feedback Solution: 1. Identify the system configuration: The system is a unity feedback control system with forward gain $G(s)$. 2. Write the transfer function formula: $T(s) = \frac{G(s)}{1 + G(s)H(s)}$ Since $H(s) = 1$, $T(s) = \frac{G(s)}{1 + G(s)}$ 3. Substitute $G(s)$: $T(s) = \frac{\frac{K}{s(Ts + 1)}}{1 + \frac{K}{s(Ts + 1)}}$ 4. Simplify numerator and denominator: $T(s) = \frac{K}{s(Ts + 1) + K}$ 5. Express as a standard transfer function: $T(s) = \frac{K}{Ts^2 + s + K}$ Final transfer function: $T(s) = \frac{K}{Ts^2 + s + K}$ This transfer function is fundamental for analyzing system stability and response.

Example 2: Stability Analysis Using Routh-Hurwitz Criterion

Question: Determine the stability of the system with characteristic equation: $s^3 + 2s^2 + 3s + 6 = 0$ Solution: 1. Construct the Routh array: | Degree | Coefficients | | | | | s^3 | 1 | 3 | | s^2 | 2 | 6 | | s^1 | $(23 - 16)/2 = (6 - 6)/2 = 0$ | | s^0 | 6 | | 2. Analyze the first column: - Rows: 1, 2, 0, 6 - The zero in the s^1 row indicates a potential marginal stability or need for auxiliary equation analysis. 3. Check for sign changes: - First column: 1, 2, 0, 6 - No sign change (all positive) except zero, which suggests the system is marginally stable or unstable depending on the auxiliary polynomial. 4. Conclusion: - Since a zero appears in the first column, further analysis (such as the Routh-Hurwitz auxiliary polynomial) is required. - The auxiliary polynomial derived from the s^1 row is: $A(s) = 2s^2 + 6$ - Roots of $A(s)$ are $s = \pm j\sqrt{3}$, purely imaginary, indicating marginal stability. Result: The system is marginally stable; further damping or pole placement may be necessary for stability.
