Foundations of Linear Programming

What is Linear Programming?

Linear programming (LP) is a mathematical method used to determine the best possible outcome in a given mathematical model. It involves optimizing a linear objective function subject to a set of linear equality and inequality constraints. The primary goal is to find the values of decision variables that maximize or minimize the objective function while satisfying all constraints.

Basic Components of a Linear Programming Model

A typical LP model comprises:

- Decision Variables: Variables representing choices to be made.
- Objective Function: A linear function expressing the goal, such as profit maximization or cost minimization.
- Constraints: Limitations or requirements expressed as linear equations or inequalities.
- Non-negativity Restrictions: Often, decision variables are constrained to be non-negative.

Mathematical Formulation of LP

A standard LP problem can be formulated as follows: Maximize (or Minimize): $Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$
Subject to: $a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \leq b_1$
 $a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \leq b_2$
 $\vdots$
 $a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n \leq b_m$ and $x_j \geq 0, \text{quad } j=1,2,\dots,n$ where: - (c_j) are coefficients in the objective function, - (a_{ij}) are coefficients in the constraints, - (b_i) are the right-hand side constants.
