Solution: - Step 1: Identify knowns: - (m_1, m_2) - (v_1, v_2) - Step 2: Apply conservation laws: - Momentum: $(m_1 v_{1i} + m_2 v_{2i} = m_1 v_{1f} + m_2 v_{2f})$ - Kinetic energy (elastic collision): $(\frac{1}{2} m_1 v_{1i}^2 + \frac{1}{2} m_2 v_{2i}^2 = \frac{1}{2} m_1 v_{1f}^2 + \frac{1}{2} m_2 v_{2f}^2)$ - Step 3: Solve for final velocities: - Using standard elastic collision formulas: $[v_{1f} = \frac{(m_1 - m_2) v_1 + 2 m_2 v_2}{m_1 + m_2}] [v_{2f} = \frac{(m_2 - m_1) v_2 + 2 m_1 v_1}{m_1 + m_2}]$ - Final answer: These expressions give the velocities after collision, satisfying conservation laws.

Problem 2: Simple Harmonic Motion Period

Exemplary Problems and Their Solutions

Classic Mechanics Problem: The Rotating Disk

Problem Statement:

A uniform disk of mass (M) and radius (R) rotates freely about its central axis with angular velocity (ω) . A small mass (m) slides without friction along the radius from the center to the rim. Find the work done in bringing the mass from the center to the rim, assuming the disk is initially at rest.

Solution Outline:

1. Identify principles: Conservation of angular momentum, work-energy theorem.
2. Initial state: Disk at rest; (m) at center, no kinetic energy.
3. Final state: (m) at rim, disk rotates with new angular velocity (ω') .

Step-by-step solution:

1. When (m) moves from center to rim, it gains potential energy (if considering gravity) or kinetic energy if moving at a certain velocity. Here, since the problem involves no friction or external torque, angular momentum is conserved.
2. Initially, total angular momentum is zero.
3. As (m) moves outward, it imparts a change in the disk's rotation due to conservation of angular momentum:

$$[L_{\text{initial}} = 0 \rightarrow L_{\text{final}} = (I_{\text{disk}} + m R^2) \omega']$$

where $(I_{\text{disk}} = \frac{1}{2} M R^2)$.

1. The conservation law yields:

[

$$0 = \left(\frac{1}{2} M R^2 + m R^2 \right) \omega' \rightarrow \omega' = 0$$

]

which suggests the initial assumption needs refinement.

1. Alternatively, considering the work done by applying a force to slide (m) outward at constant speed, the work done is related to the change in kinetic energy of the system.
2. The kinetic energy of the system after (m) reaches the rim is:

[

$$KE = \frac{1}{2} I_{\text{total}} \omega'^2 + \frac{1}{2} m v^2$$

]

where $(v = R \omega')$.

1. Solving the problem fully requires integrating the incremental work and considering the effect on the disk's rotation.

Key Takeaways:

1. Conservation laws are central.
2. The problem emphasizes the importance of understanding how an added mass affects rotational motion.
3. Carefully choosing the frame of reference simplifies the solution.

Electromagnetism Problem: Induced EMF in a Rotating Conductor

Problem Statement:

A conducting rod of length (L) is rotating with angular velocity (ω) about one end in a uniform magnetic field (B) perpendicular to the plane of rotation. Find the induced emf between the ends of the rod.

Solution Outline:

1. Identify the physical principle: Faraday's law of electromagnetic induction.
2. Model the problem: The rod's rotation in the magnetic field induces an electric field.
3. Calculate the emf: Integrate the electric field along the rod.

Step-by-step solution:

1. The emf generated due to rotation can be derived using motional emf:

[

$$\mathcal{E} = \int_0^L (\mathbf{v} \times \mathbf{B}) \cdot d\mathbf{l}$$

]

1. The linear velocity at a distance (r) from the axis: $(v = r \omega)$.
2. The electric field at (r) :

[

$$E = v B = r \omega B$$

]

1. The emf between the center and the end:

[

$$\mathcal{E} = \int_0^L E dr = \int_0^L r \omega B dr = \omega B \frac{L^2}{2}$$

]

Final answer:

[

\boxed{

$$\mathcal{E} = \frac{1}{2} \omega B L^2$$

}

]

Key insights:

1. Rotation in magnetic fields induces emf proportional to angular velocity, magnetic field strength, and the square of the rod's length.
2. The problem illustrates the interplay between mechanical rotation and electromagnetic effects.
