Overview of the AASM Manual for Sleep Scoring

The AASM manual offers a systematic approach to sleep scoring, which involves analyzing polysomnographic recordings to classify sleep stages and events. The manual is updated periodically, reflecting advances in sleep medicine and research. Its primary goals are to promote standardization, improve diagnostic accuracy, and facilitate research reproducibility. Key components of the manual include: - Definitions of sleep stages - Criteria for identifying arousals - Scoring of respiratory events such as apneas and hypopneas - Identification of limb movements and other events The manual emphasizes the use of specific EEG derivations, rules for epoch classification, and the importance of context when interpreting signals.

Sleep Stages According to the AASM

Understanding sleep stages is fundamental to sleep scoring. The AASM classifies sleep into several stages based on EEG patterns, muscle activity, and eye movements.

Wakefulness (W)

- Characterized by low-amplitude mixed frequency EEG activity - Eyes are open or closed - Muscle tone is generally high, especially during wakefulness with eyes closed - Presence of alpha waves (8-13 Hz) when awake with eyes closed

NREM Sleep

NREM sleep is subdivided into three stages:

1. Stage N1 (Light Sleep):

1. Transition from wakefulness to sleep
2. EEG shows low-voltage mixed frequency activity, theta waves (4-7 Hz)
3. Reduced muscle activity and slow eye movements

2. Stage N2:

1. Presence of sleep spindles (12-14 Hz bursts) and K-complexes

2. EEG dominated by theta activity
3. Absence of rapid eye movements
3. **Stage N3 (Slow Wave Sleep):**
 1. Dominance of delta waves (0.5-2 Hz, high amplitude)
 2. Sleep is deepest and most restorative
 3. Less responsiveness to external stimuli

REM Sleep (Rapid Eye Movement)

- EEG resembles wakefulness with low-amplitude mixed frequency activity - Rapid eye movements are prominent - Muscle tone is markedly decreased, leading to atonia - Often associated with dreaming

Scoring Rules and Criteria

The manual provides explicit rules for classifying each epoch (usually 30 seconds) into the appropriate sleep stage or event category.

Epoch Classification

- Each epoch is scored based on the predominant activity within that interval - A single epoch can contain features of multiple stages, but the dominant pattern determines its classification - The scoring process involves analyzing EEG, EOG, and EMG signals in conjunction

Rules for Specific Sleep Stages

1. **Wake:** Predominant alpha activity, alertness signs, or eye opening
2. **N1:** Transition features, low-voltage mixed activity, and vertex sharp waves
3. **N2:** Presence of sleep spindles and K-complexes that are clearly identifiable and meet amplitude and duration criteria
4. **N3:** At least 20% of epoch contains delta waves with high amplitude ($>75 \mu V$)
5. **REM:** EEG shows low-amplitude, mixed frequency activity; rapid eye movements and muscle atonia are noted separately

Event Scoring

- Arousals: Brief shifts in EEG frequency lasting 3-15 seconds, often marked by sudden EEG frequency increases - Apneas and Hypopneas: Defined based on airflow reduction and associated oxygen desaturation or arousal - Leg Movements: Periodic limb movements are scored based on amplitude and duration criteria

Handling Artifacts and Ambiguous Data

Accurate scoring requires careful identification and management of artifacts such as muscle activity, electrode noise, or external interference.

Strategies for Managing Artifacts

- Use visual inspection to distinguish true signals from noise - Mark epochs with significant artifacts as unscorable or assign a specific code - When signals are ambiguous, use contextual information and other channels to inform scoring decisions

Ensuring Consistency

- Follow the manual's guidelines strictly - Use standardized criteria for event detection - Document reasons for any deviations or uncertainties

Sleep Stage Classification in the AASM Manual Overview of Sleep Architecture Sleep is composed of cycling stages that reflect different physiological and neurobiological states. The primary stages include:

- Wakefulness
- NREM (Non-Rapid Eye Movement) sleep, subdivided into:
 - Stage N1
 - Stage N2
 - Stage N3 (also called Slow Wave Sleep)
- REM

(Rapid Eye Movement) sleep Accurate classification of these stages is critical for diagnosing sleep disorders, understanding sleep health, and conducting research. Definitions and Criteria for Sleep Stages Wakefulness Wakefulness is characterized by desynchronized, low-amplitude mixed frequency EEG activity, eye movements, and muscle tone. The manual specifies criteria such as: - EEG: Alpha activity (8-13 Hz), desynchronized EEG, or other wake-specific patterns. - EOG: Eye movements. - EMG: Muscle tone is generally higher than during sleep. NREM Sleep NREM sleep stages are distinguished primarily by EEG features: - Stage N1 (Light Sleep): - Transition from wakefulness to sleep. - Low-voltage mixed frequency EEG with a prevalence of theta activity (4-7 Hz). - Presence of vertex sharp waves. - Occasional slow eye movements. - Stage N2: - Characterized by sleep spindles (11-16 Hz bursts) and K-complexes. - EEG shows a predominance of theta activity with sleep-specific features. - No eye movements or muscle tone changes. - Stage N3 (Slow Wave Sleep): - Dominated by high-amplitude delta waves (0.5-2 Hz). - Usually constitutes the deepest NREM sleep. - No eye movements or muscle activity indicative of arousal. REM Sleep REM sleep features include: - Low-amplitude, mixed frequency EEG similar to wakefulness. - Rapid eye movements. - Muscle atonia (loss of muscle tone). - Usually occurs cyclically after NREM stages. Epoch Scoring and Temporal Resolution Sleep stages are scored in 30-second epochs, with criteria applied strictly within each epoch. The manual emphasizes consistency in epoch classification, requiring the presence of defining features for at least 10 seconds within the epoch. Scoring of Sleep-Disordered Events Apneas and Hypopneas Obstructive sleep apnea (OSA) and other sleep-disordered breathing events are central to sleep medicine practice. The manual provides detailed criteria to identify and quantify these events: - Apnea: - Cessation of airflow lasting at least 10 seconds. - Confirmed by nasal airflow or thermistor signals. - Often associated with continued respiratory effort. - Hypopnea: - Reduction in airflow of at least 30% (or as specified) lasting at least 10 seconds. - Accompanied by oxygen desaturation of 3-4% or an arousal. - The manual distinguishes between different hypopnea definitions used in research settings. Respiratory Event Scoring Rules The manual details the approach to scoring events: - Event Identification: - Use of multiple signals (airflow, respiratory effort, oxygen saturation). - Cross-verification for accuracy. - Event Duration: - Precise measurement based on signal cessation or reduction. - Event Severity: - Quantified via the Apnea-Hypopnea Index (AHI), calculated as events per hour of sleep. Limb Movements and Periodic Limb Movement Disorder (PLMD) The manual also specifies scoring criteria for limb movements: - Definition: - Limb movements lasting 0.5-10 seconds. - Occur at least 0.5 seconds apart. - Associated with arousals or EEG changes. - Periodic Limb Movements: - Repetitive limb movements occurring at regular intervals, often in bursts. AASM Manual and Technological Integration Polysomnography and Data Acquisition The manual prescribes standards for PSG setup: - Electrode placement. - Signal calibration. - Sampling rates. - Signal quality control. Automated vs. Manual Scoring While manual scoring remains the gold standard, advances in automated algorithms have been incorporated to facilitate efficient data analysis. The manual discusses: - Validation of algorithms against manual scoring. - Criteria for accepting automated results. - Integration of machine learning tools. Emerging Technologies The rise of wearable devices, home sleep testing, and telemedicine necessitate adaptations: - Simplified sensors. - Minimal electrode setups. - Automated scoring features. The manual emphasizes that, regardless of technology, core criteria must be maintained to ensure consistency. Challenges and Controversies in Sleep Scoring Inter-Scorer Reliability Despite standardization, variability persists among scorers. The manual recommends: - Regular training. - Use of consensus scoring. - Double scoring with adjudication. Evolving Definitions Some features, such as N1 sleep and hypopnea thresholds, have been subject to debate. The manual reflects consensus but acknowledges areas needing further research. Limitations of Current Criteria - Variability in event definitions affects prevalence estimates. - Differences in scoring rules can impact diagnosis severity. Future Directions Research is ongoing into refining criteria, integrating biomarkers, and leveraging AI to enhance scoring accuracy. Practical Applications and Impact Clinical Diagnostics The manual underpins the diagnosis of conditions like OSA, REM sleep behavior disorder, and PLMD, directly influencing treatment decisions. Research Standardization It enables consistent data collection across studies, facilitating large-scale analyses and meta-analyses. Education and Certification The manual serves as a core educational resource for sleep technologists and clinicians seeking certification. Conclusion The AASM manual for the scoring of sleep stands as a cornerstone document in sleep medicine. Its

comprehensive and meticulously defined criteria foster consistency and reliability in sleep assessment, which is crucial for accurate diagnosis, effective treatment, and advancing scientific understanding.
